Industrial Internship Report

“Banking Information System using Python”

Prepared by
Shivarjun Chaturvedi

Executive Summary

This report provides details of the Industrial Internship provided by Upskill Campus and The IoT Academy in collaboration with UniConverge Technologies Pvt Ltd (UCT).

This internship focused on solving real-world problems through a project-based approach. The project undertaken was “Banking Information System using Python”. The objective was to design and implement a simple banking system that allows users to perform operations such as account creation, deposit, withdrawal, and balance checking.

The internship provided valuable exposure to practical development and improved problem-solving skills. It was a great learning experience and helped in understanding real industry workflows.

Preface

This internship was conducted over a duration of 4 weeks. It provided an opportunity to gain practical knowledge and enhance technical skills.

The project focused on developing a Banking Information System using Python. The internship helped in understanding real-world applications and improved logical thinking.

I would like to thank Upskill Campus, UCT, and all mentors for their support. This internship has helped me grow both technically and personally.

Introduction

About UniConverge Technologies Pvt Ltd

UniConverge Technologies Pvt Ltd (UCT) is a company working in digital transformation and industrial solutions. It focuses on technologies like IoT, Cloud Computing, Machine Learning, and Web Development.

About Upskill Campus

Upskill Campus is a platform that provides training, internships, and career development programs for students.

Objective of Internship

- To gain practical industry experience
- To improve problem-solving skills
- To understand real-world applications
- To enhance technical knowledge

Problem Statement

The problem was to develop a simple Banking Information System that allows users to manage bank accounts efficiently.

The system should:

- Create accounts
- Deposit money
- Withdraw money
- Display balance

Existing and Proposed Solution

Existing System

Traditional banking systems are complex and require large infrastructure.

Proposed Solution

A simple Python-based system that:

- Is easy to use
- Works on console
- Provides basic banking operations

Value Addition

- Lightweight system
- Easy to understand
- Beginner-friendly

Proposed Design / Model

Working Flow

1. User selects operation
2. System processes input
3. Output is displayed

High Level Design

- Input → Processing → Output

Low Level Design

- Functions for each operation:
    - create_account()
    - deposit()
    - withdraw()
    - check_balance()

Interfaces

- Console-based interface
- User inputs via keyboard

Performance Test

Test Plan

- Test all operations

Test Cases

- Valid input
- Invalid input

Outcome

- System works correctly for all basic operations

My Learnings

During this internship, I learned:

- Python programming basics
- Problem-solving skills
- Logical thinking
- How real-world systems are designed

This internship improved my confidence and technical skills.

Future Work Scope

- Add GUI (Graphical Interface)
- Connect with database
- Add login system
- Improve security
